Effective communication for an efficient hospital

The communication system forms the beating heart of a hospital. It ensures that patient calls go to the right person and enables nursing staff to work as efficiently as possible.

Televic Healthcare has been a genuine asset to the sector for over 60 years. The long-term support for the various generations of call-systems is unique in the market!

THE TOP COMMUNICATION SYSTEM FOR HOSPITALS

INTERAXIO, DEVELOPED FOR AND BY NURSING STAFF

- Safe and reliable calls and processing
- Improved efficiency due to two-way communication connection
- Fulfils the highest European norms for patient communication security
- Sleek integration within existing IT infrastructure
- Sufficient flexibility allows settings to be tailored to department-specific functions
- Comprehensive configuration options for rooms with multiple-beds
- Open function with validated multimedia and care connections

Total control of the room

Maximum control of communication is essential for both patient and nursing staff. The patient requires one simple device for controlling his environment and, if necessary, calling for help with one press of a button. A nurse needs an overview of ongoing calls and the ability to engage in a conversation with a patient but must also be able to operate the patient rooms.

SEAMLESS INTEGRATION OF CALL BUTTONS

- Calls are made using secure buttons at strategic locations in the room.
- Modified call buttons are available for each department.
 - EOA REA call units
 - blowswitches
 - mattress detectors
 - ultra-sensitive switches
 - vandal-proof call buttons
- Calls are directed to the responsible nurse.
- The nurse can then immediately talk to the patient.
- Close collaboration with classic bed control panel suppliers.
- Our call system is perfectly compatible with mobile phones.

UNIQUE MULTIMEDIA HANDSET

- The only handset with touch-screen functionality, for optimum user-friendliness
- Unique multimedia handset for making calls and operating TV and radio.
- Music, lighting and TV can all be controlled from the bed using the hand-held terminal.
- The nurse can then immediately talk to the patient via the AxioApp intercom phone.

More time for care via optimised communication

INCREASED EFFICIENCY

An intelligent communication system such as interAxio from Televic Healthcare offers endless possibilities. It is used primarily for **patient comfort** but also to optimise **internal communication**. This function means reduced administration and greater efficiency. Consequently, the hospital organisation automatically performs more efficiently.

USE OF IDENTIFICATION

The installation of a system such as interAxio also increases the accuracy of various control systems.

You could start working with an intelligent key system: easy to manage via user-friendly software.

A badge system can also be added to the personal key in order to simplify checks and increase overall efficiency. The interAxio nurse call and access control system now also supports Desfire from Mifare.

“

“The broad range of services across the Televic network offers genuine added value while, at the same time, the call function remains the main priority. The reliability and durability of the Televic solution offers complete peace of mind.”

Facilities Director.

“

“I am very enthusiastic about the Televic interAxio system’s complete IP approach. It permits sleek integration within our existing ICT environment and is easy to upgrade.”

Technical Director.

“

“When the hospital’s directors decided to work with interAxio, we were a little baffled by the new technology. But the system is very user-friendly. We wouldn’t be able to work without it now.”

Nurse.

interAxio is the result of multiple user-studies and the elaboration of innovative ideas. PRoF is one of the most innovative platforms in this context.
